Course Description

Steam Injection is a thermal drive process that adds heat to the reservoir to expand the oil-in-place, reduce it viscosity, provide drive and thereby improve the displacement efficiency of injected fluid. This course explores the concepts behind steam injection processes in the field. The emphasis is the practical aspects of steam injection. Equations and calculation methods are included in the course. There is an emphasis on the surface facilities, field practices, and operational problems. The material presented in this course is directed toward engineers, technicians, independent operators.
